

Autism expression improved in our daughter

We live in a rural area with the youngest of our 6 children who is now 11. She was born with Down's syndrome and a resultant heart defect that required open heart surgery at Auckland when she was 4 months old. We wanted to go past managing her condition and find ways to improve it. As a result we discovered some important ways to do this.

In mid 2011 it was noticed that our daughter's autism expression was in need of further help.

We searched for some solution, and discovered that lifting glutathione levels could help. The doctor, who had helped us with valuable things already, was involved with a new product. This was impacting autism among many other things, by lifting glutathione levels significantly. There is a strong connection between low glutathione and autism.

Our daughter was a bright, outgoing child, who loved to show off and meet new people. This was changing dramatically with the autism expression getting louder. She became highly anxious in any area that she was required to perform i.e. from reading aloud, eating breakfast (with someone watching), to school productions.

We have enjoyed some good changes, with her now more likely to do required tasks. If some reluctance is encountered we can generally work her through it. Our daughter is laughing a lot more and her play is more creative. The anxiety mood can be broken into easier and life is more pleasant. The teachers at school have been further surprised with more certificates issued. We are assured these have to be earned not given out lightly.

We were delighted to watch her in the latest school play participating fully and loving it. She was laughing in the back seat most of the way home with enjoyment and accomplishment.

We are thankful to have these important products to help us from Max International.
